02:21

## Button Element

The `<button>` tag is used when you want to put a button on the page. It could be a button when you submit a form that links to another page or any other possibility.

```
<html>
  <body>
    <button>Click Me!</button>
  </body>
</html>
```

Click Me!

One of the main attributes used when you have a button is `onclick`. As you dive deeper into *Coding from Scratch*, you will find more ways to use `onclick`. However, for now, take a look at how it's used below:

```
<html>
  <body>
    <button onclick="alert('Hello!')">Click Me!</button>
  </body>
</html>
```

Click Me!

If you click on the button above, notice an alert popped up saying "Hello!". You will be learning more about the JavaScript `alert()` method later on in the course. Just be sure to understand that `onclick` is used to run JavaScript when the button is clicked.
