

Thinking Like a Programmer

Breaking Down Problems Review

The skills of deconstructing problems and then precisely communicating your instructions will take time to hone. Fortunately, you will have plenty of chances to practice these skills. Try to remember, the process of breaking down the problem and identifying what you want to do next is often the trickiest part. Writing out your list of what do I have to work with and what steps are needed to accomplish my goal are valuable skills at any level of experience or technical competency. It's no coincidence that ample amounts of whiteboards are widespread in areas where developers are working.
